

We see your
smile differently.

su^{re}smile[®]

to be sure.

precision never before possible.

suressmile digital technology was developed specifically for orthodontic treatment. A 3-D model of your teeth allows us to analyze your bite from every possible angle. Using this model and suressmile's computer analysis, we determine your optimal and completely customized treatment prescription. Each and every movement of each and every tooth is calculated to create the beautiful, healthy smile of your dreams.

how does suressmile work?

Instead of bending orthodontic archwires by hand, your archwires will be custom-shaped using state-of-the-art robotic technology. This means that your teeth move directly to the prescribed position after the archwire is inserted. You'll see great results in a shorter treatment time than previously possible with conventional orthodontics

discover the smile of your dreams.

suressmile digital technology helps us to achieve faster, more precise results.

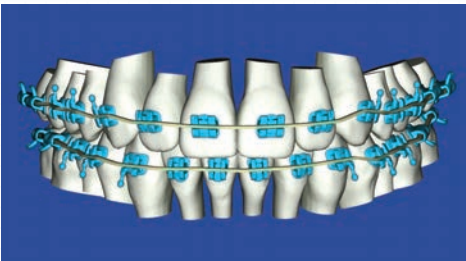

digital scanning

An initial 3D model of your teeth using digital scanning technology.

treatment planning

Using 3D virtual simulations, your optimal treatment plan is determined.

treatment designed just for you!

To achieve your treatment goals, customized wires are formed just for you. Based upon your digital plan, suressmile technology provides a series of customized archwires that will gently move your teeth into their planned position, precisely.
